

Claude Code: SXSW 2026 Recap Site Build

What This Repo Is

This repo contains a Figma Make export of a 10-page SXSW 2026 conference recap site. The exported code is the visual reference, not the production codebase. Your job is to rebuild this as a proper Astro site using the design tokens, content schemas, and architecture already defined in this repo.

Read these files first before writing any code:

1. `CLAUDE_CODE_INSTRUCTIONS.md` — full build spec, component architecture, data flow, phase order
2. `tailwind.config.mjs` — all design tokens (colors, typography, spacing) are already defined
3. `src/content/sessions/_template.mdx` — session content schema
4. `src/content/trends/_template.mdx` — trend content schema
5. All JSON files in `src/data/` — stats, quotes, footprint, linkedin series, resources

What To Do

Step 1: Assess the Figma Export

Look at the existing code in the repo. Identify:

- Which pages exist and what they contain
- The HTML structure and CSS patterns Figma generated
- Any assets (images, SVGs, icons) worth keeping
- What to discard (Figma's absolute positioning, auto-generated class names, duplicate files, broken image references)

Do not try to fix the Figma code. You are rebuilding from scratch using it as visual reference.

Step 2: Initialize Astro

Set up a clean Astro project in the repo root. Keep the existing files (CLAUDE_CODE_INSTRUCTIONS.md, tailwind.config.mjs, src/data/, src/content/). Move the Figma export into `design-reference/figma-export/` so it stays accessible but is not part of the build.

```
npm create astro@latest . -- --template minimal --install --no-git
```

Install dependencies:

```
npx astro add react tailwind
npm install @astrojs/react @astrojs/tailwind
npm install recharts # for trend visualization
```

Configure `astro.config.mjs`:

- Add React integration (for interactive islands)
- Add Tailwind integration pointing to existing `tailwind.config.mjs`
- Set site URL to empty for now
- Output: static

Step 3: Set Up Content Collections

Create `src/content/config.ts` with Zod schemas matching the frontmatter in the template files. Define two collections: `sessions` and `trends`.

Create 3–5 placeholder session files and 2–3 placeholder trend files using the templates so the build has content to render. Use realistic but clearly placeholder titles like “[PLACEHOLDER] Session Title Here”.

Step 4: Build the Layout

Create `src/layouts/BaseLayout.astro`:

- HTML head with Inter font from Google Fonts, meta tags, Tailwind
- Dark header (#0A0A0A) with site title “SXSW 2026 Recap” and navigation links to all pages
- Mobile hamburger menu
- Footer (#0A0A0A): name, one-line title, LinkedIn and Forbes links, “Built from field notes. Not a corporate recap.” copyright 2026

- Page background #F7F5F0
- Max content width 1200px centered

Step 5: Build Pages in This Order

Follow the layouts and sections described in `CLAUDE_CODE_INSTRUCTIONS.md`.
Reference the Figma export in `design-reference/figma-export/` for visual direction on each page. Match the visual hierarchy and layout patterns, not the Figma code.

Page 1: Home (`src/pages/index.astro`)

- Dark hero section with title, subtitle, placeholder photo area
- Stats grid reading from `src/data/stats.json` (show both event and personal stats)
- Pull quotes reading from `src/data/quotes.json` with alternating colored cards (green, coral, dark)
- Footprint timeline reading from `src/data/footprint.json`
- Navigation cards linking to subpages with green left border
- All sections should have proper vertical spacing (96px between sections)

Page 2: Trend Report (`src/pages/trends.astro`)

- Short dark hero
- Methodology note section
- Placeholder area for signal chart (gray box with caption, will be replaced later)
- Trend cards as a React island (`TrendGrid.tsx`): 2-column grid, expandable on click, reads from trends content collection
- Each card: trend number in green, title, signal summary, supporting evidence, interpretation, track tag pills
- Cross-reference footer linking to session library

Page 3: Session Library (`src/pages/sessions.astro`)

- Short dark hero with search bar
- Sticky filter bar as a React island (`SessionFilter.tsx`): track pills and format pills, client-side filtering
- Session count display

- Session card grid (`SessionGrid.tsx`): 3 columns, track-colored top stripe, title, speakers, date, summary excerpt, "Read more" expansion
- Reads from sessions content collection at build time, passes as props to React

Page 4: Workshop Recap (`src/pages/workshop.astro`)

- Dark hero with "WORKSHOP RECAP" label, title, co-leader credit, track/format tags, placeholder photo
- Two-column overview: premise text left, quick facts card right
- Vertical stepper for methodology walkthrough (4-5 steps with numbered circles, placeholder image areas)
- Participant quote cards (3, alternating colors)
- Dark full-width editorial synthesis section ("What This Proves")
- CTA cards linking to roundtable and booking

Page 5: Roundtable Recap (`src/pages/roundtable.astro`)

- Dark hero with "BRAINDATE RECAP" label in coral, title, Braindate explainer
- Large pull quote for the central provocation
- Discussion theme cards (4-5, single column, with "tension" callout blocks using coral left border)
- Staggered participant quote grid (6-8 cards with varied background tints)
- Dark synthesis section ("What I Took Away")
- CTA cards linking to workshop and trend report

Page 6: LinkedIn Series (`src/pages/linkedin-series.astro`)

- Dark hero
- Series overview paragraph
- Article cards reading from `src/data/linkedin-series.json` : single column, large number left, title/date/excerpt/link right

Page 7: Book (`src/pages/book.astro`)

- Two-column dark hero: endorsements left, placeholder book cover right
- About the book section with buy CTA button

- SXSW context section with placeholder signing photo

Page 8: Photo Gallery (`src/pages/gallery.astro`)

- Dark hero
- Masonry grid with placeholder image areas in varied aspect ratios
- Caption overlay on hover (semi-transparent dark gradient, white text)

Page 9: About (`src/pages/about.astro`)

- Two-column layout: placeholder headshot left, bio and links right
- Dark credentials bar (Forbes, Roosevelt board, Gies MBA, construction background)
- Contact section with email CTA

Page 10: Resources (`src/pages/resources.astro`)

- Dark hero
- Category sections reading from `src/data/resources.json`
- Resource cards in 3-column grid per category, color-coded left border by category

Step 6: Responsive

After all pages are built, make a responsive pass:

- Mobile (375px): single column everything, hamburger nav, stacked cards, smaller type scale
- Tablet (768px): 2-column grids where desktop is 3
- Desktop (1440px): full layouts as designed

Step 7: Polish

- Add page transition animations (subtle fade-in on scroll using Intersection Observer)
- Add OG meta tags to each page (title, description, image placeholder)
- Generate sitemap
- Test all internal links
- Verify all JSON data files load correctly
- Confirm React islands hydrate properly (session filters work, trend cards expand)

Design Rules

- Cards: white background, shadow-sm, rounded-lg (8px), consistent padding (p-6)
- Green left border on nav/CTA cards: border-l-4 border-sxsw-green
- Track tag pills: text-xs px-2 py-0.5 rounded-tag, colored background from track palette, white text
- Format tag pills: same size, #F7F5F0 background, #6B6B6B text
- Section titles: text-section-heading (32px bold), #1A1A1A, left-aligned
- Section labels (small uppercase above titles): text-label, tracking-wide, uppercase, #12674A
- Pull quote decorative marks: 72px, 30% opacity white
- Stat numbers: text-stat (48px extrabold), sxsw-green
- Dark sections: #0A0A0A background, white text
- Light sections: #F7F5F0 background
- Never use pure white (#FFFFFF) as page background; always #F7F5F0
- Maximum content width: 1200px
- Maximum prose width: 800px (for long-form editorial sections)

Do Not

- Do not use the Figma export code as-is. Rebuild from scratch.
- Do not add a database or CMS. Everything is file-based.
- Do not add authentication.
- Do not install a CSS framework besides Tailwind.
- Do not use absolute positioning for layout (Figma's bad habit).
- Do not create separate CSS files. Tailwind utility classes only, plus the config.
- Do not hardcode content that exists in JSON data files. Always read from the data.
- Do not skip placeholder content. Every page should render with placeholder data so the site is fully navigable during content entry.

When You Are Done

The site should:

- Build with `npm run build` without errors
- Run with `npm run dev` and show all 10 pages
- Be fully navigable with working internal links
- Show placeholder content on every page
- Have working client-side filtering on the session library
- Have working expandable cards on the trend report
- Be responsive at 375px, 768px, and 1440px breakpoints
- Be ready for content entry (drop in MDX files and images, they render automatically)
